

Solar Success at Apartment Buildings

Above is the largest evacuated tube solar hot water collector array in Maine. This 540-tube system, installed atop a 30-unit apartment building in Topsham, is saving more than 2,000 gallons of propane and offsetting more than 26,000 lbs. of CO2 emissions per year.

Based on the outstanding performance of the 540-tube system in the topmost photo, the same property owner had ReVision Energy install a separate flat plate solar hot water system on another 30-unit in Falmouth.

Above is a 360-tube solar hot water collector array atop a 20-unit apartment building in Falmouth. This system is saving more than 1,500 gallons of propane and eliminating more than 20,000 lbs. of CO2 per year.
